C:\Windows\System32\drivers\etc\hosts

```
# Copyright (c) 1993-2009 Microsoft Corp.
#
# This is a sample HOSTS file used by Microsoft TCP/IP for Windows.
#
# This file contains the mappings of IP addresses to host names. Each
# entry should be kept on an individual line. The IP address should
# be placed in the first column followed by the corresponding host name.
# The IP address and the host name should be separated by at least one
# space.
#
# Additionally, comments (such as these) may be inserted on individual
# lines or following the machine name denoted by a '#' symbol.
#
```

For example:

```
#  
# 102.54.94.97 rhino.acme.com      # source server  
# 38.25.63.10  x.acme.com         # x client host
```

localhost name resolution is handled within DNS itself.

Observações:

- O método attach() insere os registros especificados no array toda vez que a página for recarregada.
- O método sync() insere os registros especificados no array apenas uma vez, não interessando quantas vezes a página for recarregada.
- Qualquer um dos dois métodos acima ao ser executado exclui todos os municípios que já estão cadastrados e inserem os que forem passados como parâmetros.
